

Portland General Electric

Utility FP&A model on public filings: FERC, EIA and NOAA

[Plan against actual](#) · [weather normalization](#) · [price-volume-mix](#) · [rolling forecast](#) · [scenarios](#) · [peers](#)

Every figure is a live formula, Power Query step or DAX measure over public regulatory data: PGE's monthly returns to the U.S. Energy Information Administration, its audited annual FERC Form 1 (processed by Catalyst Cooperative's PUDL project), and NOAA's degree days for the Willamette Valley.

Independent analysis. Not affiliated with or endorsed by Portland General Electric.

Built by [Kush Patel](#) · [github.com/KushPatel29/excel-fpa-model](#)

Model status **All 31 checks pass** [Open the checks →](#)

Five questions it answers, live from the model

Is the year on plan, and if not, why?	Year to date \$100.9M under plan (-6.4%): weather −\$40.4M, price −\$42.3M, usage −\$18.3M. Plan →
How much of that is the weather?	Weather against normal: -212 GWh and −\$38.7M of revenue this year. Weather →
Where did revenue growth come from?	Since 2019: price +\$993.6M, volume +\$275.4M, mix −\$89.0M. PVM →
Where will the year land?	Retail revenue \$3.01B, +2.7% on 2025; a point of rate on the open months is worth \$15.4M. Forecast →
How does PGE compare with its neighbours?	Industrial load growing 10.9% a year, rank 1 of 5; retail price 14.9¢/kWh, rank 2 of 5. Peers →

Sheets

Sheet	What it shows	Excel on show
Dashboard	One page: plan against actual, weather, price mix, the outlook, and a summary written by formulas.	Formula-driven commentary, waterfalls, combo chart, sparklines, LET
PnL	Twelve years of PGE's electric P&L from FERC Form 1, with unit economics.	SUMIFS over a long table with array criteria, named LAMBDA's, CAGR
PVM	Where retail revenue growth came from: volume, mix and price by customer class.	Exact three-effect decomposition, waterfall
Monthly	EIA's monthly survey by class, a revenue heat map, and the EIA-to-FERC tie-out.	SUMIFS, colour scales, cross-source reconciliation
Weather	How much load follows the thermostat; this year's weather impact.	LINEST on FILTER + HSTACK, normals with FILTER/AVERAGE
Plan	A plan built only from data before the year, against actuals, split four ways; backtested.	Month-by-class model, what-if data table on the plan year
Forecast	The rest of the year from drivers and observed weather; a FORECAST.ETS cross-check.	XLOOKUP with fallbacks, FORECAST.ETS
Scenarios	Weather, rates, data-center load: tables that re-run the model, and a tornado.	One- and two-variable data tables, SORTBY + HSTACK
Peers	PGE against four Pacific Northwest utilities on price, growth and cost.	SUMIFS by respondent, RANK.EQ
Explore	The same data as a Power Pivot model: PivotTable, slicers, CUBEVALUE.	Power Pivot, DAX (TREATAS time intelligence), CUBEVALUE
Checks	31 controls that prove the numbers, each with its own tolerance.	Reconciliations
Assumptions	Model controls and weather scenarios.	Named inputs, validation
PQ_Monthly	EIA's wide layout unpivoted to one row per month and class.	Power Query: unpivot, split, pivot
PQ_Weather	NOAA's fixed-width text parsed into degree days by month.	Power Query: split by position
Data_EIA	The public extracts, exactly as published.	Excel tables, structured references

How to use it

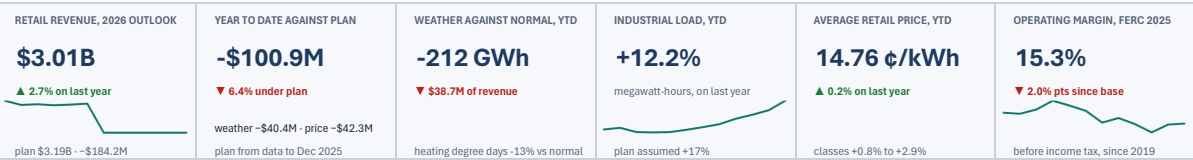

1 Move a lever	Scenarios!C4:C9: weather, a rate change, new data-center load. Every sheet follows.
2 Re-run the plan as of another year	Plan!C4. The backtest on the same sheet does it for four years.
3 Explore the data model	The slicers on Explore filter a PivotTable built on DAX measures.
4 Refresh the data	python pipeline/fetch_sources.py downloads the latest public releases; rebuild.

Sources and conventions

EIA-861M	U.S. Energy Information Administration, monthly electric utility sales and revenue. Public domain.
FERC Form 1	Federal Energy Regulatory Commission annual report, via Catalyst Cooperative's PUDL (CC BY 4.0).
NOAA nClimDiv	NOAA National Centers for Environmental Information, divisional degree days. Public domain.
+1.0%	Input: blue on yellow. Change these; everything else is calculated.
+1,234 (1,234)	Variances are signed so favourable is positive (green) and unfavourable is in brackets (red).

Portland General Electric: 2026 retail revenue, plan and outlook

Actuals from EIA through June 2026 - FERC Form 1 through 2025 - weather: NOAA, Willamette Valley - scenario: Normal - All 31 checks pass

What the numbers say

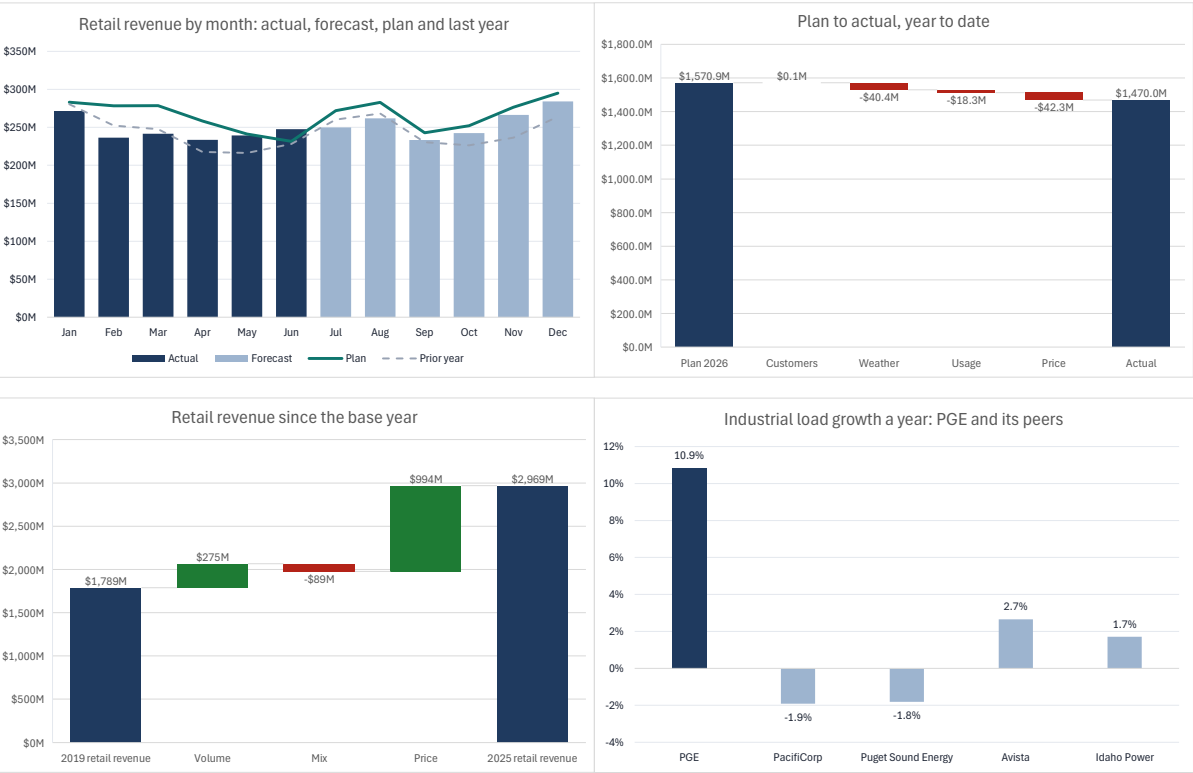

Retail revenue for Jan-Jun came in \$100.9M (6.4%) under plan: weather ~\$40.4M, price ~\$42.3M, usage ~\$18.3M, customers +\$79K.

Heating degree days ran 13% below normal: 212 GWh of load and \$38.7M of revenue lost to the thermostat, at actual prices.

Every class paid more per kWh (+0.8% to +2.9%), yet the average rose +0.2%: the growth is industrial load (+12.2% MWh), billed at 9.4¢ against 18.9¢ residential.

Since 2019, retail revenue is up \$1.18B: price +\$993.6M, volume +\$275.4M, mix ~\$89.0M. Power cost rose faster than revenue, and operating margin fell 2.0% points.

Full year 2026: \$3.01B, +2.7% on 2025, \$184.2M under plan. A point of rate on the open months is worth \$15.4M; 50 MW of new data-center load, \$21.1M.

Plan against actual by class, Jan-Jun				Full-year outlook by class, 2026					
Class	Plan	Actual	Variance	% Class	Actual YTD	Forecast	Full year	Growth

Price, volume and mix: where retail revenue growth came from

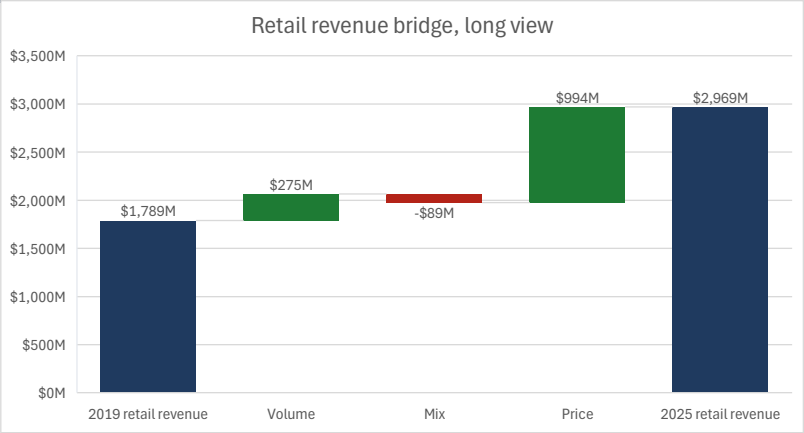

Each class's change in MWh is valued at the earlier period's average price (volume) and at its own price's distance from that average (mix); price is the change in \$/MWh on the later period's MWh. The three effects add up to every class's revenue change: column O is zero.

2024	19,272,621	19,272,622	(1)	2,751,081,902	2,783,029,228	(31,947,326)	(1.1%)
2025	19,968,295	19,968,167	128	2,928,179,950	2,969,346,620	(41,166,670)	(1.4%)

Volumes agree to within a few MWh a year. EIA's revenue runs 1–2.5% under FERC's: the monthly survey reports billed sales, the annual filing books accounting revenue (unbilled accruals, deferral amortization and other adjustments).

Weather: how much of the load is the thermostat

Monthly MWh per customer regressed with LINEST on heating and cooling degree days (Willamette Valley, base 65°F) and a time trend, fitted from the fit start to the December before the fiscal year.

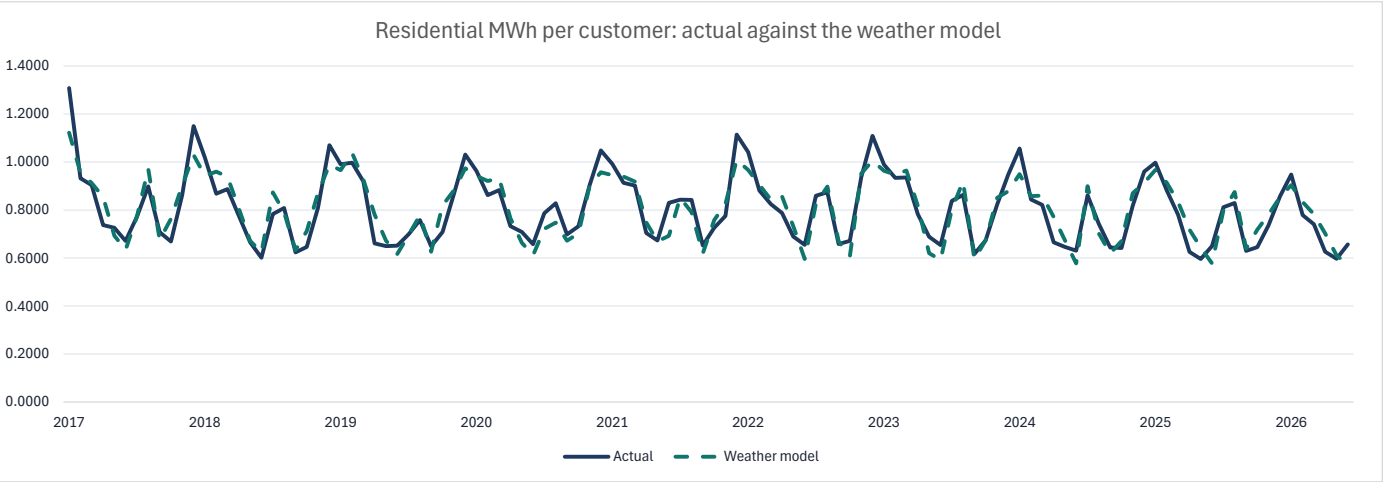

Weather model, fitted Jan 2017 to Dec 2025							
Class	Intercept	Per HDD	Per CDD	Trend per year	R ²	Months	Key
Residential	0.495966	0.000678	0.002678	-0.007518	0.838	108	residential
Commercial	4.905829	0.000628	0.007371	-0.065020	0.583	108	commercial

MWh per customer per month: per degree day, and per year of trend. LINEST returns the coefficients last variable first; the formula puts them back in reading order.

Normal weather: the average of 2016–2025, by month													
Month	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Year

Year to date	-370	+9			(192,808)	(35,883,133)			(18,706)	(2,791,102)	(211,514)	(38,674,235)

Weather took 212 GWh and \$38.7M off retail revenue this year, valued at each month's actual price.

Plan against actual: the 2026 plan, built only from data through December 2025

Customers grow at last year's rate; residential and commercial use comes from the weather model at normal weather; industrial volume and every class's price grow at last year's rate. The bridge splits actual minus plan into customers, weather, usage and price, exactly.

Plan year 2026 Change it to re-run the plan as of an earlier year-end; the backtest below does exactly that.

2025	12	3,323,531,658	2,928,179,950	(11.9%)	13.5%	3.9%
2026	6	1,570,903,132	1,469,962,155	(6.4%)	9.1%	4.6%

Volume is forecastable: MWh misses by about 4% a month. Price is not, from history: PGE's rates move in steps set by rate cases, so a plan that extrapolates last year's increase overshoots when a big step does not repeat. Plan price from the rate case calendar.

Rolling forecast: June 2026 actuals, 6 months forecast

Customers and industrial volume grow at the year-to-date rate; residential and commercial use comes from the weather model, with NOAA's observed degree days where the month has passed and normal (times the year-to-date rate, plus any rate change on Scenarios.

Drivers, year to date

Scenarios: what moves the 2026 outlook

Change a lever and every sheet follows. The tables below are Excel what-if data tables: each re-runs the whole forecast with a lever changed, so nothing here is an approximation.

Weather, months not yet observed	Normal	scenario 1	Normal, Mild or Cold: the multipliers are on Assumptions.
Rate change on open months	0.0%		Added to every class's price from the first open month.
Extra data-center load	0 MW		Average megawatts of new industrial load, running around the clock.
Customer growth overlay	0.0%		Scales open-month customers (and industrial volume) up or down.
Heating degree-day overlay	1.00x		Multiplies the scenario's heating degree days.
Cooling degree-day overlay	1.00x		Multiplies the scenario's cooling degree days.

New data-center load	+50 MW	3,007,664,837	3,028,765,686	+21,100,849
Heating degree days	-10%	3,007,664,837	2,985,580,046	(22,084,791)
Cooling degree days	+10%	3,007,664,837	3,009,678,136	+2,013,299
Customers	+1%	3,007,664,837	3,023,041,864	+15,377,027

What would offset a mild autumn?	
Revenue lost if the open months are mild	26,501,749
Rate change on the open months that recovers it	1.75%
A mild rest of the year would cost \$26.5M of retail revenue: about a 1.8% rate change on the open months, or 63 MW of new data-center load from now.	

Workings: one small data table per lever (base value, then the step)

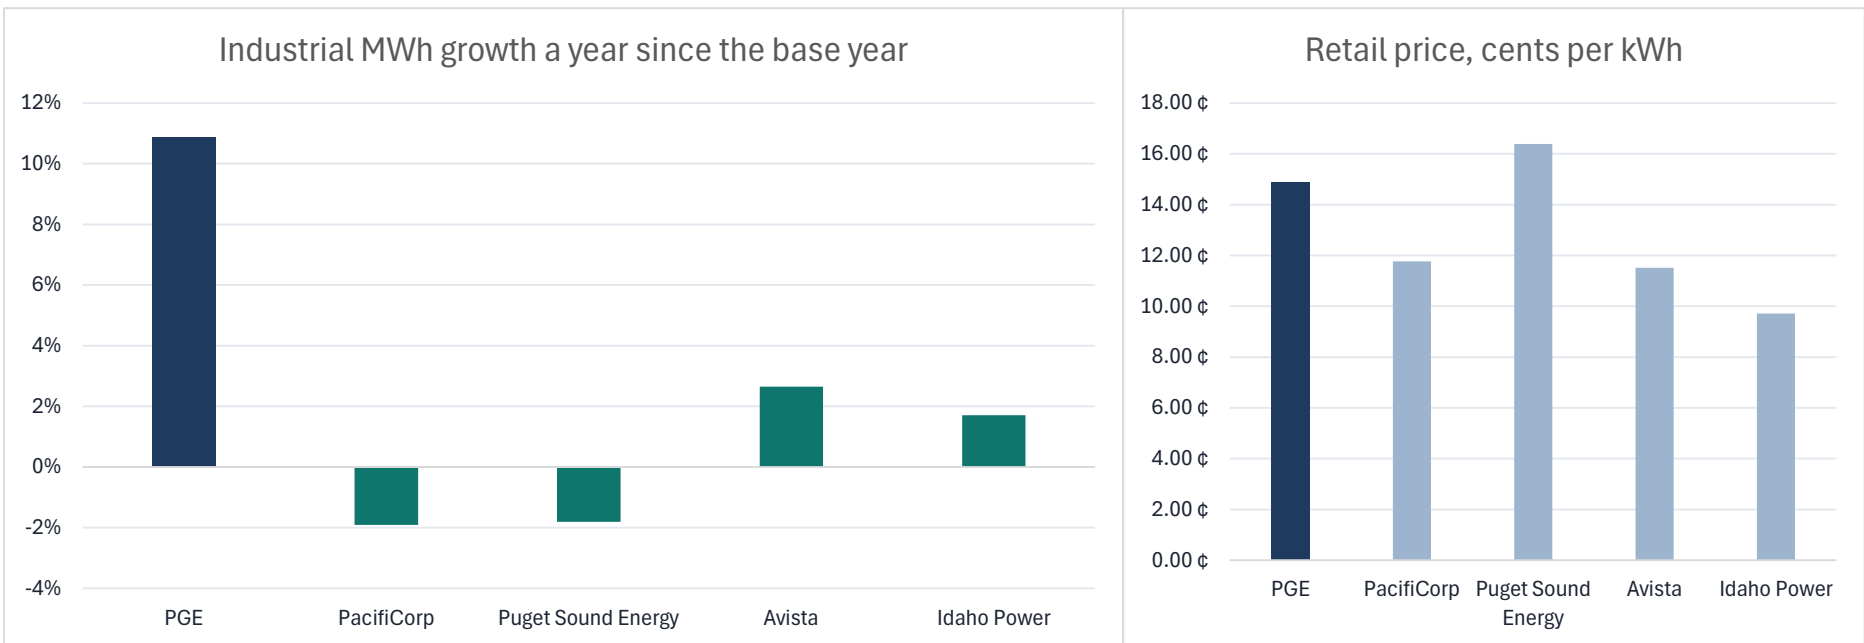

Rate change on open months		3,007,664,837
	0	3,007,664,837
	0.01	3,023,041,864
New data-center load		3,007,664,837
	0	3,007,664,837
	50	3,028,765,686
Heating degree days		3,007,664,837
	1	3,007,664,837

Chart data: sorted by size	
Cooling degree days	+2,013,299
Rate change on open months	+15,377,027
Customers	+15,377,027
New data-center load	+21,100,849
Heating degree days	(22,084,791)

Peers: PGE against four Pacific Northwest utilities (FERC Form 1)

Electric operations only, as filed with FERC. Price and cost metrics are for 2025; growth is the yearly rate since 2019. Rank 1 is the highest value.

Metric	PGE	PacifiCorp	Puget Sound Energy	Avista	Idaho Power	PGE rank
FERC respondent id	250	303	162	182	216	
Retail revenue	2,969,346,620	6,966,157,006	3,473,690,941	1,123,713,791	1,571,541,674	3 of 5
Retail MWh	19,968,167	59,211,862	21,194,633	9,756,846	16,179,760	3 of 5
Retail customers	955,654	2,136,853	1,251,443	424,410	657,261	3 of 5
Retail price, ¢/kWh	14.87 ¢	11.76 ¢	16.39 ¢	11.52 ¢	9.71 ¢	2 of 5
Residential price, ¢/kWh	18.79 ¢	15.16 ¢	17.01 ¢	13.37 ¢	11.78 ¢	1 of 5
Industrial share of retail MWh	29.6%	30.7%	4.9%	24.6%	23.4%	2 of 5
Retail MWh growth a year	+2.4%	+1.1%	+0.3%	+1.3%	+1.8%	1 of 5
Industrial MWh growth a year	+10.9%	(1.9%)	(1.8%)	+2.7%	+1.7%	1 of 5
Retail price growth a year	+6.2%	+5.6%	+8.2%	+4.2%	+3.6%	2 of 5
Power cost per MWh sold, \$	\$44.32	\$46.32	\$50.20	\$27.39	\$33.20	3 of 5
Other O&M per customer, \$	\$1,010.41	\$1,005.84	\$831.49	\$953.18	\$820.67	1 of 5
Operating margin before income tax	15.3%	11.5%	12.5%	19.2%	19.8%	3 of 5

Checks: the model proves its own numbers

All 31 checks pass

Controls							
#	Check	Expected	Actual	Difference	Tolerance	Status	Why it matters
1	EIA rows loaded = source	114.00	114.00	–	0.01	PASS	Nothing dropped or duplicated.
2	EIA megawatt-hours = source control total	175,214,498.36	175,214,498.36	–	0.01	PASS	
3	EIA revenue = source control total	20,607,177.13	20,607,177.13	–	0.01	PASS	
4	No month missing from EIA	114.00	114.00	–	0.01	PASS	A gap would shift every year-over-year comparison.
5	EIA classes add up to EIA's total: revenue	–	0.00	0.00	0.01	PASS	The regulator's own arithmetic, checked.
6	EIA classes add up to EIA's total: MWh	–	0.00	0.00	0.01	PASS	
7	Power Query unpivot keeps every value	456.00	456.00	–	0.01	PASS	Four classes per month after the unpivot.
8	Power Query dollars = EIA thousands × 1,000	20,607,177,126.00	20,607,177,126.00	–	0.01	PASS	
9	NOAA rows loaded = source	40.00	40.00	–	0.01	PASS	
10	NOAA parse: one row per month, no gaps	236.00	236.00	–	0.01	PASS	Fixed-width parsing done in Power Query.
11	FERC rows loaded = source	1,706.00	1,706.00	–	0.01	PASS	
12	FERC retail = the classes, every year	–	–	–	0.01	PASS	The P&L rebuilds retail from the classes; it must meet FERC's own subtotal.
13	FERC total revenue = the lines, every year	–	–	–	0.01	PASS	
14	FERC O&M schedule = the income statement, every year	–	5.00	5.00	100	PASS	Two FERC schedules that must agree; they differ by a few dollars of rounding over
15	EIA and FERC agree on MWh, every full year	–	0.00	0.00	0.001	PASS	Two regulators, two filings, the same volumes (within 0.1%).
16	EIA and FERC revenue within 3%, every full year	–	0.02	0.02	0.03	PASS	Billed against booked revenue: the gap is explained on Monthly.
17	Weather model fitted on every month before this year	108.00	108.00	–	0.01	PASS	
18	Weather explains most residential use ($R^2 \geq 0.7$)	–	–	–	0.01	PASS	A weak fit would turn the weather effect into noise.
19	PVM reconciles in every class: long view	–	–	–	0.01	PASS	Volume + mix + price = the revenue change, class by class.
20	PVM reconciles in every class: last year	–	0.00	0.00	0.01	PASS	
21	PVM reconciles in every class: year to date	–	0.00	0.00	0.01	PASS	
22	Plan bridge closes in every month and class	–	0.00	0.00	0.01	PASS	Customers + weather + usage + price = actual – plan.
23	Plan bridge total = actual – plan	(100,940,977.38)	(100,940,977.38)	–	0.01	PASS	
24	Outlook = actuals + forecast	3,007,664,836.84	3,007,664,836.84	–	0.01	PASS	
25	Outlook actuals = EIA year to date	1,469,962,155.00	1,469,962,155.00	–	0.01	PASS	
26	Weather table matches the live model	3,007,664,836.84	3,007,664,836.84	–	0.01	PASS	The data table re-ran the same model the sheets show.
27	Sensitivity grid matches the live model	3,007,664,836.84	3,007,664,836.84	–	0.01	PASS	
28	Rate tornado is exact: 1 point of rate = 1% of open-month revenue	15,377,026.82	15,377,026.82	0.00	0.01	PASS	The brute-force data table agrees with the algebra.
29	Data model = formulas: this year's revenue	1,469,962,155.00	1,469,962,155.00	–	0.01	PASS	DAX and SUMIFS are independent engines.
30	DAX year-over-year = formula year-over-year	–	–	–	0.000001	PASS	Time intelligence with TREATAS, checked against plain SUMIFS.
31	Dashboard outlook tile = Forecast	3,007,664,836.84	3,007,664,836.84	–	0.01	PASS	

Source control totals, taken from the extracts when the workbook was built

Control total	Value	Source
EIA monthly rows	114	data/eia_pge_monthly.csv, row count
EIA total MWh	175,214,498.364	data/eia_pge_monthly.csv, sum of total_mwh
EIA total revenue (\$000)	20,607,177.126	data/eia_pge_monthly.csv, sum of total_revenue_k
FERC rows, three schedules	1,706	data/ferc_*.csv, row counts
